Local Search Explore State-space Landscape

A one-dimensional state-space landscape in which elevation corresponds to the objective function. The aim is to find the global maximum. (Russel & Norvig, 2010)

- A landscape has “location” (defined by state) and “elevation” (value of objective or heuristic cost value).
- Local search aims to find global optimum.
- Problem: depending on initial state, can get stuck in local optimum.
